

Exam Announcement – Data Science Exam 2026

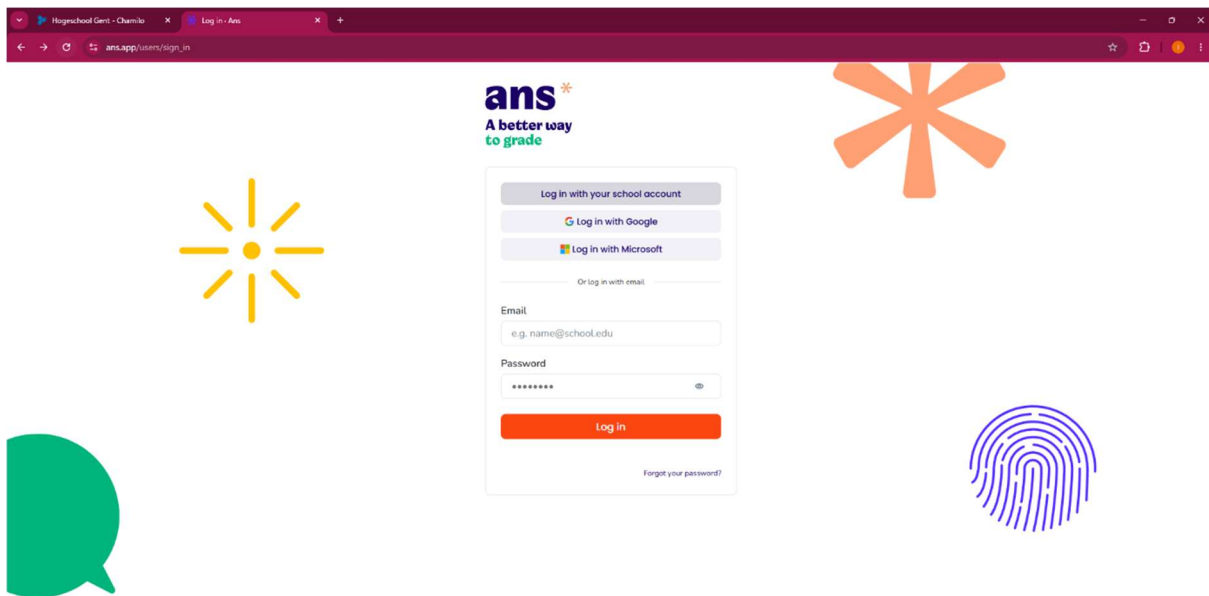

Assessment

- **First exam opportunity:**
 - o 100% Written exam on PC (own laptop), with resources (see below)
 - o 2 parts: Python section (everything requiring Python code) + ANS section
- **Second exam opportunity:**
 - o Idem

Sample exam + ANS test exam

You can find a sample exam in the GitHub repository for the lab exercises, under the [RepeatExercises](#) directory. A test exam is also available in ANS.

If this is the first time you use ANS, you must first select HOGENT in the window below.

The full exam consists of 2 parts: Python section + ANS section

Python section (12:30 – 14:00, or 14:22 for students with extra time)

- The exam is completed in **Visual Studio Code** or **Google Colab**. Use one or the other, **not both**!
- Download the exam from **exam.hogent.be** as a Jupyter Notebook (.ipynb). At the end, upload your solution there again.
- If you do not come to campus often, it is a good idea to arrive a little early so you can test whether your internet connection works before the exam.

- Make sure your laptop is correctly configured so you can start the exam right away. Technical problems with the required software are your own responsibility.
- Rename the Jupyter Notebook file **before** opening it: replace SURNAME and FIRSTNAME with your name.
- Fill in your name, student number, exam date and time, and class group in the first Markdown cell. If you are an IOEM student, indicate this as well.
- Add code cells where needed to work out the answers to the questions.
- **TIP!** Avoid reusing generic variable names (e.g. data, df, ...) across different questions; use descriptive names wherever possible (e.g. penguins, agri_businesses, aus_athletes, etc.). If you switch between questions during the exam, you might overwrite variables and get incorrect results or runtime errors.
- If the answer to a question is a real number, always round to exactly four decimal places, unless explicitly stated otherwise. Very small numbers may be written in scientific notation (e.g. 1.2345×10^{-6} or $1.2345e-6$).

Submission:

- Submit the Notebook file (.ipynb, with your name in the filename!) via **exam.hogent.be**. Do **not** pack it in a .zip/.rar or submit it in any other file format!
- Immediately after the exam, make sure your Panopto recording has been uploaded, has the correct name, and has been shared with the correct lecturer.
- Students taking the exam on campus must sign the attendance list.

What is allowed during the Python section?

- Worked-out notebooks + exercises as published on the course's GitHub repository. Nothing extra!
- A self-made summary (in English or Dutch) of these worked-out notebooks or exercises. The content is again limited to what was published on the course's GitHub repository. Nothing more! This summary must be opened in Visual Studio Code or Google Colab — not in Word, etc.

What is NOT allowed during the Python section?

- AI tools / internet / communication in any other form / forums / mobile phone / LLMs / ...
- Autocomplete tools
- Any form of communication with fellow students or third parties is of course forbidden. This means no:
 - o Mobile phone, smartphone, or smartwatch
 - o Headphones, wired or Bluetooth earphones (earplugs or ear defenders without electronics are allowed)

- o Communication apps such as Discord, Messenger, WhatsApp, Teams, email clients, chat applications, etc. Don't forget to turn off all desktop notifications, as incoming notifications are also considered communication.
- o Internet + websites that allow communication, e.g. Facebook, Q&A sites like StackOverflow, forums, etc.
- o Large Language Models such as ChatGPT, LLaMA, Copilot Chat, Bing Chat, Google Bard/Gemini, etc. The use of GitHub Copilot is also forbidden.
- o Other applications, websites, etc. that outsource answering exam questions to an external party (e.g. Mechanical Turk).
- o *Any other form of communication or method by which you do not answer the exam questions yourself, not listed above.*

Recording

- All students must make a recording of the exam, which is shared with the lecturer of the class group you are enrolled in *immediately after the exam* via Panopto.
- For the on-campus exam, a recording of your screen and the built-in webcam of your laptop is sufficient.
- All [guidelines for Panopto exam recordings](#) apply. Read these carefully and follow the instructions strictly. Prepare in advance by creating a folder with the correct name and sharing it with the appropriate lecturer.
- At the start of the exam, show:
 - o That AI assistance is disabled:
 - Google Colab: Tools > AI assistance > all options are disabled
 - VS Code: go to Extensions (Ctrl+Shift+X) and show all installed extensions. Search in particular for “copilot” and show that it is not installed. Other LLM-powered extensions are of course also not allowed!

ANS section (14:30 – 15:30, or 15:45 for students with extra time)

- The exam is completed using ANS only.
- Make sure your laptop is correctly configured so you can start the exam right away. Technical problems with the required software are your own responsibility.
- Scratch paper will be available.
- A test exam is available so you can try out how ANS works.
- The worked-out notebooks (not the exercises) will be attached to the ANS exam (see test exam).

What is allowed during the ANS section?

- A self-made summary (in English or Dutch) of the worked-out notebooks or exercises is permitted. The content is again limited to what was published on the course's GitHub repository. Nothing more! The summary is limited to 2 A4 pages printed recto-verso, with a minimum font size of 11pt and margins of at least 1 cm.
- Nothing else may be used.

ATTENTION! If your submission is incomplete (Notebook, Panopto recording, and/or signature on the attendance list), you cannot demonstrate that you completed the exam correctly and honestly. In that case, it is also not possible for us to assess you, and your exam result will be **0/20**.
